Every year Queensland floods, and millions of litres of water cause damage to infrastructure and business. If the authorities could use this water and redirect it inland, you could put the water into the river systems like darling etc -bore pipelines through mountains like in the snowy mountains, pump the water into the rivers, environmental flows increase and dams could be filled. This might be a better solution long term, and could save a lot of water during the wet season Broken Hill almost ran out of water, the Menindee lakes were empty, Lake Weatherill and Pameroo weren't much better. I can understand why the lakes need to be drained for environmental flows (BUT IF THE LAKES WERE EMPTY -YOU WOULDN'T BE ABLE TO PUMP FOR ENVIRONMENTAL FLOWS) With the evaporation and pumping -if the lakes end up empty again the environment will suffer again and it will put the city of BROKEN HILL and the people's lives at risk. Please look at other options,
